

# TELEHANDLERS

Reach into places your competitors' lifting equipment cannot with telehandler booms made in Strenx® performance steel. The telehandler is equipped with a telescopic boom that can be mounted with different attachments that easily turn it into an aerial work platform, lift truck, or earthmoving crane. However, many telehandlers are limited by their greatest advantage. As the boom extends while bearing a load, it acts as a lever and can cause the machine to become unstable. What does this mean for its lifting capacity? It quickly decreases as the distance between the front of the wheels and the center of the load increases. A single boom used as a loader must be carefully designed and capable of withstanding very high loads to overcome this weakness. With Strenx® performance steel, you can innovate your designs to maintain high load capacity while lifting higher and farther. So why not get help with tackling the most challenging terrains, and reaching the height of performance?
