

LOADER CRANES

Get the power without the excess weight, while increasing the productivity of tons loaded per time unit, for increasingly complex and specialized operations that require more precision and flexibility from loader cranes.

Longer reach and improved lifting capacity, all without altering the dead weight. Loader crane manufacturers are successfully leveraging Strenx® high-strength steel grades to lift loads to previously inaccessible places. And, they're also saving weight while improving the number of load cycles per time unit.

With its unique and carefully developed chemical composition, Strenx® performance steel makes stronger and tougher welds possible, resulting in safer cranes that load more and lift higher.

1. Strenx® 960, 1100 and 1300 High-strength steels
and Strenx® Tube 700MLH High-strength steel tubes
